

Wine for the Win!

Protecting one of America's favorite beverages

Three Main Ingredients

Grapes

Sugar

Yeast

• Powdery mildew causes more total losses for wine grape growers than any other disease. **Fungicides serve as protectants** to prevent powdery mildew from reaching your vineyard.

The grape berry moth is the most destructive grape insect in the eastern U.S. **Using insecticides can help save your grapes,** preventing these pests from returning next year.

Young grapevines do not compete well with grasses and weeds, such as Johnson grass and poison ivy. **Herbicides can help decrease weed populations** before planting grapevines. Pesticides can ensure there is enough wine to go around!
